Christmas Office Hours

We are taking a break over Christmas/ New Year from 5pm on December 22nd until January 9th. We'll still be checking messages and responding to emails, so get in touch if you need to.

OSET Nitrogen Reduction

AES has been at OSET in Rotorua undergoing the research and development phase in Trial 12 since September 2016. We are pleased with the performance of AES. Final reports are being written up now and will be released early next year. The same system is already two months into Trial 13. This time around a small pump has been added to allow recirculation of the treated effluent back through the bottom of the septic tank to increase nitrogen reduction.

Results from the research and development phase, July – October achieved TN <10g/m³.

The recirculation pump is on a timer, with gravity overflow through a Salcor 3G UV unit before collection in the discharge tank. The UV unit will be switched on part way through Trial 13, in order to measure power usage with and without the UV unit. Both the recirculation and the UV unit are optional additions, which allow designers to customize AES to specific sites.

The photo to the right shows the Salcor 3G UV unit in the foreground. Normally this would be installed underground.

Environmental Compliance Conference

Around 200 people attended the Environmental Compliance Conference in Auckland 8-10th November. Dick, Hazel and Rae from Environment Technology attended the sessions and talked with many people at our exhibition stand which presented case studies of AES installations and showcased the Salcor UV disinfectant unit. The aim of the conference was to bring together local government officers, to hear the views of experienced peers, exchange ideas, review best practice, learn from case studies and catch up with colleagues.

We had some interesting communications with attendees on a range of topics including municipal systems nearing capacity, concerns about another Havelock North occurring, upgrading existing systems that are failing, as well as other projects coming up where AES would be the ideal solution.

Orua Campground, Auckland - Large AES Project

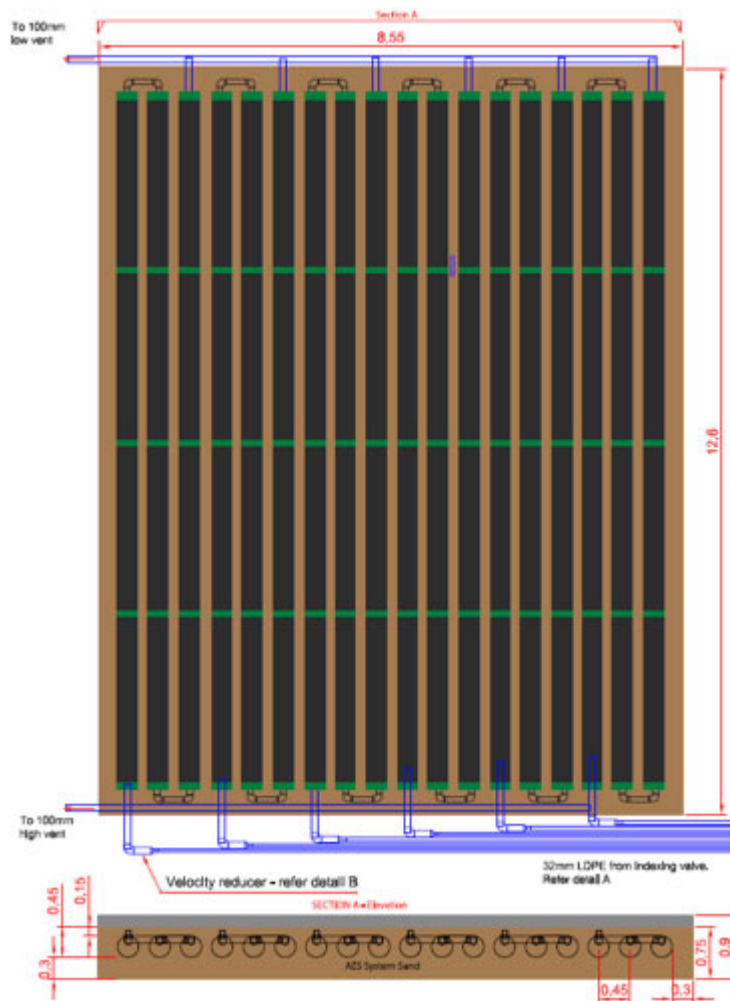

AES has come to the Auckland region, offering a simple and cost-effective method of treating wastewater on site while also protecting the environment.

Orua Bay Motor Camp is the first site in the Auckland area to install an AES on-site wastewater treatment system. Designed by engineer Fraser Walsh of Ground Consulting in conjunction with Environment Technology and installed by Waiuku drainlayer Jim Douglas, AES was chosen by owner Jim Caldwell because: “The system is suited to our small site, is visually unobtrusive and requires no maintenance”.

The existing septic tanks have been retained as part of the AES upgrade. A dual pump system receiving input from a level transducer in the pump chamber pumps the primary effluent up to the AES bed. The bed had to be installed on higher ground to achieve the necessary vertical separation from groundwater, which required the installation of the pump chamber. An indexing valve is used to deliver the effluent to six sections of the AES bed. At peak flow each section will receive around 1300L/d.

The layout of the six sections of AES pipes is below.

For more information about AES wastewater treatment systems visit the [resources page on our website](#), [watch the introductory videos](#), or call us on 0800 927 834 (0800 waste H2O).
